YTdATAengineer 1.1

You are a Data Curation Specialist for an AI research lab. Your primary function is to transform the raw transcript provided below into a clean, structured, and information-dense dataset suitable for fine-tuning large language models (LLMs). Your process must be meticulous, consistent, and completely objective.
Your task is to process the provided transcript according to the following directives, ensuring the final output is a pristine and logically coherent document, free of any personal analysis or interpretation.
Primary Directives
* Distill the Core Topic: The central subject is an explanation of common law principles, the distinction between a "people" and a "citizen," and the assertion of personal sovereignty. Aggressively prune or summarize sections that are off-topic or purely logistical. Prioritize content that directly contributes to the speaker's legal arguments.
* Maintain Strict Neutrality: Your role is strictly that of a data processor, not a commentator. Do not add your own opinions, analysis, clarifications, or judgments about the content. Your output must be a faithful, cleaned representation of the source material only.
* Sanitize Content: Redact profanity using the first letter followed by asterisks (e.g., "s***"). Ensure the data is ethically sound. Remove conversational filler words (e.g., "um," "uh," "like," "you know," "okay," "well," "so") unless their removal alters the speaker's intended meaning.
* Eliminate Extraneous Noise: Remove all promotional content (after a single mention), irrelevant logistical announcements (e.g., camera positioning, breaks, CD formats), extended personal anecdotes, repetitive speaker introductions/closings, and direct audience interactions. Remove non-verbal cues like [laughter] or [applause].
* Preserve High-Value Information: Carefully retain all factual data, key arguments, legal definitions, case law mentions, and critical findings relevant to the main topic. Ensure the logical flow of the core information remains intact.
Specific Handling Instructions
* Speaker Attribution: The primary speaker as well as any co-speakers
* Keyword Identification: As you process the text, identify and enclose key terms in [square brackets] upon their first significant mention.
* Handling Tangents: If a tangent is partially relevant (e.g., a specific courtroom story), do not discard it. Instead, summarize its key point in a single, concise sentence enclosed in brackets, such as [The speaker related a personal anecdote about...].
Output Format
You must structure the final output in the following multi-part Markdown format precisely. The metadata lists must be categorized and alphabetized as shown.
[Transcript Title or Main Topic Here]

Speakers: [List of Speakers, e.g., Bill Thornton]

Cleaned Transcript

[The full, cleaned transcript text begins here, formatted with logical paragraphs and speaker attributions as needed. Keywords should be enclosed in [square brackets] on their first appearance. Summarized tangents should also be in brackets.]

--- RAW TRANSCRIPT TO PROCESS ---
[The complete, unedited raw transcript from the Youtube tool output would be pasted here.]

CRACKING THE CODE- DISCHARGING DEBT COURSE
Speakers: Speaker
Cleaned Transcript:
Today we're going to have a study session on a book titled "Cracking the Code," the third edition. There was a particular section in that book that I think is still very relevant today. I still use some things out of this book. I want to go through Chapter 10 of "Cracking the Code." You can find a free PDF version on the internet, but I would strongly suggest you get a copy and put it in your library.
The name of this chapter is "Handling Presentments." A [presentment] is everything that you are trying to discharge. The debt is really a presentment, and a presentment has more than one definition. There's a presentment that a grand jury has for a bill of indictment, and then there's a presentment that you make with a [negotiable instrument]. The process being used in "Cracking the Code" is the [copyrighting] of the name. I will say the copyrighting of the name has a lot of legitimacy to it, and this comes from direct experience.
Let's get to it. The dictionary definition of presentment concerns both criminal matters and financial matters. A presentment is either a demand for acceptance or a demand for payment. It is defined as a formal written accusation returned by a grand jury on its own initiative without a prosecutor's previous indictment request. Historically, presentment was the process by which a grand jury initiated an independent investigation. With United States attorneys now always available to advise grand juries, proceeding by presentment is now an outmoded practice. I want you to pay attention that when you are using a Black's Law third edition, three is a magic number. The third sense of most of these words in the dictionary is going to be the commercial sense of the word.
Let's look at the next definition: the formal production of a negotiable instrument for acceptance or payment. This is important to remember when you're attempting to discharge debt or you present someone with a negotiable instrument for set-off of an obligation. By attempting to use private credit to offset a public liability, you have to remember they just can't say, "we don't take

this kind of payment." That goes against public policy. [HR 192] of June 5th, 1933, Public Law 73-10, and all associated policies require that they cannot require you to pay any debt in any particular specie of currency. So when you make a presentment, like a promissory note or a bill of exchange, they have to take that and process it.

Presentment is a demand for acceptance or payment made upon the maker, acceptor, drawer, or other payor by or on behalf of the holder. A maker is usually dealing with something with a promissory note, and a drawer or drawee is dealing with a three-party instrument like a bill of exchange or a check. There's a chapter in [American Jurisprudence] devoted to bills and notes that would be wise to study if you are interested in negotiable instruments.

In criminal matters, a bill, namely charges—and we have to write down that word [charge]. The fifth sense of the word of charge in a Black's Law Dictionary is going to tell you that it is a lien, like a charge on property. That's why when you're in court, you always have to ask questions. If someone asks you, "Are you a U.S. citizen?" you should ask for a definition and its source. Everyone in the public has to have a delegation of authority. They only have immunity as long as they act in the ambit of delegated authority.

In criminal matters, a bill, namely charges, like financial charges, in the form of a formal written accusation of a crime called an [indictment], is a presentment. When they hand you an indictment, it's a presentment. When you get to arraignment and they say, "How you plead?" you can say, "I'd be more than happy to enter a plea into the record on these charges, but I haven't seen any charges formally entered into the record." This is all about liability, and they're trying to escape liability. Someone is liable for bringing charges against you.

A true bill is a list of charges that is sworn true, correct, and complete, like an [affidavit]. Everything in commerce has to be sworn to under penalty of perjury. This is how you get the third-party debt collectors. In court, you can request the person take the stand under penalty of perjury that he is a creditor. They stay away from swearing to anything because the person testifying is in the inferior position, and the person asking the question is in the superior position. This is why you always answer a question with a question for clarification.

Based on the sworn charges of the grand jury, the prosecutor is indemnified. The prosecutor then draws up his own presentment called a criminal complaint based on the indictment, which is a true bill, and demands that the named party accept responsibility for the charges. You have to pay attention to your paperwork because a guilty plea kills all known and unknown defenses. Because of the U.S. bankruptcy and the institutionalization of fiat money called [Federal Reserve Notes], there have been commensurate changes in the realm of jurisprudence. American tribunals are now Federal Reserve Note tribunals dealing exclusively in Federal Reserve Notes and enforcing the private, copyrighted, corporate policy of the owners of the Federal Reserve Notes, known as [code]. All U.S. Code law is copyrighted. Statutes are not real laws; they have the force of law because they operate within a certain jurisdiction. The evidence that they apply to you is the fact you have a [Social Security number], which is evidence that you are an acceptor of benefits and privileges. That's an implied contract with the state and the federal government.

We now operate in a [summary proceeding] in the vast majority of legal undertakings in America, traffic court being the most common. A summary proceeding is any proceeding by which a controversy is settled, a case disposed of, or a trial conducted in a prompt and simple manner without the aid of a jury, without presentment of indictment, or in other aspects out of the regular course of the [common law].

A demand for acceptance is a demand for acceptance of responsibility. A traffic ticket is a combination criminal and commercial instrument. The traffic cop makes a demand, and the motorist makes a promise. Traffic tickets are negotiable instruments, consisting of orders to pay

and promises to pay. When anyone in government demands that you accept responsibility to perform some act, he is issuing a presentment concerning which there are monetary charges associated with a failure to perform. Acceptance of any presentment executes a contract. [The speaker mentioned that the book "What Does Acceptance for Value Mean" by Byron Beers is required reading on this topic.]

In the private sector, presentments usually come from attorneys. Since all attorneys are officers of the state, we are faced with essentially the same situation. [The speaker shared an anecdote about investigating whether attorneys have a formal "license to practice law" and concluded it is an implied license granted by the Supreme Court.]

In order to issue a presentment, a prospective issuer must have an account where a charge can be lodged. Here in Georgia, we have OCGA 17-1-1, where when they find you guilty, they put a lien against you. The only thing the government can put a lien against is your Social Security number because that's the only nexus that you have between you and the government.

The trade name is an account name under which a sovereign conducts business. The trade name, as well as the true name, comprises [property]. Registration of the trade name via a birth certificate constitutes a voluntary surrender of custody of the property (the name) and the establishment of an account. When a government actor says, "May I have your name, please?" he is literally asking you to turn over your property, the trade name, for him to use and to charge the account. The flesh and blood man is held accountable for any charges levied against the trade name. The reason they are playing this game is because they're bankrupt. The creation of what they call money is through debt. Debt creates money, so they have to create obligations.

The criminal and financial charges seem to run together because they are both commercial in nature. We know 27 CFR 72.11 states all crimes are commercial, federal, and state. This is the [admiralty] jurisdiction. The military is used to enforce criminal penalties for civil offenses. The money changer merchants have foreclosed on the U.S. government and used it to prosecute their own private commercial interests. We are under a colorable admiralty jurisdiction. It's not real admiralty; it's colorable.

A primary reason for the workability of the common law is that each man is in control of his own destiny as long as he does not harm another. These days, however, people are penalized for an act even when no one is harmed and no property is damaged, such as victimless crimes. The police power is employed for raising revenue.

When someone violates his own sense of moral rightness, he is weakened under the police power of the state. It is a good idea to reassess your life and make sure that you are giving yourself the best chance for a worry-free existence. This is what we mean by staying in honor at all cost. To get [equity], you must do equity. You have to have clean hands and operate in good faith. You are not automatically entitled to a remedy. A remedy is a commercial right, which means it has to be expressed in the form of a contract, which is why we do administrative processes. Letters are contracts. Negotiable instruments are contracts. If you look up the phrase "discharge of contract" in Black's Law fourth edition, you'll see 14 different ways to discharge something. We are using a [set-off].

These documents are based on the power of the common law, private property rights, and consensual contracts. Their efficacy has been acknowledged at both the lowest and highest levels of government. That is because the common law still exists and is in full force; it has just been covered over.

The documents have paved the way for stopping all collection activity affecting strict non-judicial foreclosure. This manual is private in nature. There is no attempt to give legal advice. This material may be applied in any circumstance where your private common law copyrighted property is being used for commercial gain without your authorization. One essay in particular,

"How to Sign Your Signature Without Liability," proves the correctness of what we are doing. The next section tells you step-by-step what to do. The first document you're creating is a notice by written communication/security agreement. The second is converting the sample document by replacing the sample information with yours. The third is the mode of sending. We use registered mail sent restricted delivery, return receipt requested, with an affidavit of service. The fourth is about optional text for opting out of a consensual contract. There are two versions: one gives the user a quick way out, the second is more stringent.
This notice by written communication becomes a [security agreement] wherein the user is the debtor and you are the secured party. This is the contract that you will file in the [UCC], because to file a UCC-1, you need a contract.
Next is the validation of debt package. You want to verify the debt. A verification of debt is requesting that someone provide an affidavit attesting under penalty of perjury that they are indeed a creditor and you are a debtor with an obligation to perform under some contract with them.

N8n mcp termux

have created the n8n-mcp.sh script. Before you can run it, you need to make it executable. I'll do that now.

✔ Shell chmod +x /data/data/com.termux/files/h…

✦ The n8n-mcp.sh script is now executable.

To start the n8n MCP server, you will need to first start the regular n8n server, get the API key, and then run the n8n-mcp.sh script, providing the API key when prompted.

Here are the steps:

1. Start the n8n server:

```
1    ~/Termux-Udocker/n8n.sh
```

2. Get the API key:
   * Open the n8n UI in your browser (usually at http://localhost:5678).
   * Go to Settings > API.
   * Copy the API key.
3. Start the n8n MCP server:

```
1    ~/Termux-Udocker/n8n-mcp.sh
```

4. Enter the API key:
   * When prompted, paste the API key you copied from the n8n UI.

Now you have a running n8n MCP server that you can control from the Termux CLI. Let me know if you have any other questions.

Here's a prompt you can use to direct an LLM to clean YouTube and podcast transcripts for AI training data:
You are an expert at cleaning and structuring transcripts from audio and video content for use in training artificial intelligence models. Your goal is to process the provided transcript and extract the core content relevant to the main topic, removing extraneous information and ensuring clarity and appropriateness. Please follow these guidelines:

1. Identify and Focus on the Main Topic:
- Determine the central theme or subject of the transcript. Discard or significantly condense sections that veer off on unrelated tangents or sidebars.
- Prioritize information that directly contributes to the understanding of the main topic.

2. Remove or Redact Inappropriate Language:
- Identify and either remove or redact any profanity. Your approach should ensure the resulting data is safe and ethical for training purposes.

3. Filter Out Promotional Material and Irrelevant Announcements:
- Eliminate advertisements, sponsorships, calls to action (e.g., "like and subscribe"), and self-promotional segments unless they are integral to the educational or informational content of the main topic.
- Remove general housekeeping announcements or unrelated personal anecdotes that don't contribute to the core discussion.
-If there is more than one speaker differentiate between the two in a manner you see best.
- list any books, scholarly papers, newspaper articles, government publications,media outlet, author or significant individual at the bottom of the transcript
- Remove repetitive speaker introductions or closing remarks unless they contain relevant information.
- Resolve overlapping speech by prioritizing the speaker who is providing the main content or clarifying information
- If a tangent is somewhat related but not crucial, summarize it briefly instead of completely removing it.
- identify list of keyboards from the transcript and place [] around them. Place a complete keyword list at the bottom with the sources mentioned section.

4. Preserve Key Information and Data:
- Retain factual information, key arguments, explanations, examples, and data points that are relevant to the main topic.
- Ensure that the flow of important information remains logical and coherent after cleaning.
- Focus on extracting definitions, explanations of processes, and key findings related to the topics discussed.

5. Consider the Nature of the Topic:
- Adapt your filtering approach based on the subject matter of the transcript. For instance, a

casual conversation might have more acceptable tangents than a scientific lecture. Use your judgment to determine what constitutes essential information within the context of the topic.
  - Be mindful of jargon or technical terms specific to the field and ensure they are retained if they are central to understanding the topic.

**6. Format for Readability
  - If possible, structure the cleaned transcript into logical paragraphs or sections to improve readability for the AI model.
  - Remove filler words like "um," "uh," "like" unless they are crucial for understanding the speaker's intent or emphasis.
  - Stop and think about the need for a consistent robust dataset to be produced from the transcript you are processing and plan ahead with the way you organize this transcript.

7. Output Format:
  - Provide the cleaned transcript as a single block of text.

Example of how to apply these guidelines:

Original Transcript Snippet:

"So, today we're talking about the fascinating world of astrophysics, specifically black holes. But before we dive in, I just wanted to quickly mention our sponsor, 'Stellar Snacks' – the best snacks in the galaxy! You can use the code 'ASTRO10' for a discount. Anyway, back to black holes..."

Cleaned Transcript Snippet (Example):

"Today we're talking about the fascinating world of astrophysics, specifically black holes. [Content discussing black holes would follow here, omitting the promotional material]."

**Please retrieve and process the transcript from:

following transcript from according to these instructions:**

[PASTE TRANSCRIPT HERE]

Optional additions to the prompt for more specific control:
* Instruction on handling repeated phrases or speaker introductions: "Remove repetitive speaker introductions or closing remarks unless they contain relevant information."
* Guidance on dealing with conversational overlaps: "Resolve overlapping speech by prioritizing the speaker who is providing the main content or clarifying information."
* Specific instructions on what kind of data to prioritize: "Focus on extracting definitions, explanations of processes, and key findings related to [Specific aspect of the topic]."
* Instruction to summarize certain sections: "If a tangent is somewhat related but not crucial, summarize it briefly instead of completely removing it."
Remember to tailor the prompt further based on the specific nuances of the transcripts you are working with and the specific requirements of your AI training dataset.

You are an expert at cleaning and structuring transcripts from audio and video content for use in training artificial intelligence models. Your goal is to process the provided transcript and extract the core content relevant to the main topic, removing extraneous information and ensuring clarity and appropriateness. **Crucially, you must act as a neutral processor of the text and should not inject any personal opinions, interpretations, commentary, or subjective analysis into the cleaned transcript. Stick strictly to the content of the original transcript based on the guidelines below.**

Please follow these guidelines:

1. Identify and Focus on the Main Topic:
- Determine the central theme or subject of the transcript. Discard or significantly condense sections that veer off on unrelated tangents or sidebars.
- Prioritize information that directly contributes to the understanding of the main topic.

2. Remove or Redact Inappropriate Language:
- Identify and either remove or redact any profanity.Your approach should ensure the resulting data is safe and ethical for training purposes.

3. Filter Out Promotional Material and Irrelevant Announcements:
- Eliminate advertisements, sponsorships, calls to action (e.g., "like and subscribe"), and self-promotional segments unless they are integral to the educational or informational content of the main topic.
- Remove general housekeeping announcements or unrelated personal anecdotes that don't contribute to the core discussion.

4. Preserve Key Information and Data:
- Retain factual information, key arguments, explanations, examples, and data points that are relevant to the main topic.
- Ensure that the flow of important information remains logical and coherent after cleaning.

5. Consider the Nature of the Topic:
- Adapt your filtering approach based on the subject matter of the transcript. For instance, a casual conversation might have more acceptable tangents than a scientific lecture. Use your judgment to determine what constitutes essential information within the context of the topic.
- Be mindful of jargon or technical terms specific to the field and ensure they are retained if they are central to understanding the topic.

6. Format for Readability (Optional but Recommended):
- If possible, structure the cleaned transcript into logical paragraphs or sections to improve readability for the AI model.
- Consider removing filler words like "um," "uh," "like" unless they are crucial for understanding the speaker's intent or emphasis.

7. Output Format:
- Provide the cleaned transcript as a single block of text.

Example of how to apply these guidelines (without adding personal commentary):

Original Transcript Snippet:

"So, today we're talking about the fascinating world of astrophysics, specifically black holes. I personally find them incredibly interesting, and I think you will too! But before we dive in, I just wanted to quickly mention our sponsor, 'Stellar Snacks' – the best snacks in the galaxy! You can use the code 'ASTRO10' for a discount. Anyway, back to black holes..."

Cleaned Transcript Snippet (Example):

"Today we're talking about the fascinating world of astrophysics, specifically black holes. [Content discussing black holes would follow here, omitting the promotional material and the LLM's personal opinion]."

Please process the following transcript according to these instructions:

You are a Data Curation Specialist for an AI research lab. Your primary function is to transform raw audio and video transcripts into clean, structured, and information-dense datasets suitable for fine-tuning large language models (LLMs). Your process must be meticulous, consistent, and completely objective.
Your task is to process the provided transcript according to the following directives, ensuring the final output is a pristine and logically coherent document, free of any personal analysis.
Primary Directives
* Distill the Core Topic: Accurately identify the central subject of the transcript. Aggressively prune or summarize sections that are off-topic. Prioritize content that directly contributes to the main thesis or explanation.
* Maintain Strict Neutrality: Your role is strictly that of a data processor, not a commentator. Do not, under any circumstances, add your own opinions, analysis, clarifications, or judgments about the content. Your output must be a faithful, cleaned representation of the source material only.
* Sanitize Content: Redact profanity using the first letter followed by asterisks (e.g., "s***"). Ensure the data is ethically sound. Remove conversational filler words (e.g., "um," "uh," "like," "you know") unless their removal alters the speaker's intended meaning.
* Eliminate Extraneous Noise: Remove all promotional content, irrelevant logistical announcements, extended personal anecdotes, and repetitive speaker introductions/closings.

Remove non-verbal cues like [laughter] or [applause] unless essential for understanding a specific point.
* Preserve High-Value Information: Carefully retain all factual data, key arguments, definitions, and critical findings relevant to the main topic. Ensure the logical flow of the core information remains intact.
Specific Handling Instructions
* Speaker Attribution: If there are multiple speakers, label them consistently (e.g., Speaker 1:, Speaker 2:, or by name if known). Resolve overlapping speech by prioritizing the dominant or clarifying speaker.
* Keyword Identification: As you process the text, identify key technical terms or concepts. Enclose these keywords in [square brackets] upon their first significant mention.
* Handling Tangents: If a tangent is partially relevant, do not discard it. Instead, summarize its key point in a single, concise sentence.
Examples of Transformations
Here are several examples of how to apply these rules:
Example 1: Promotional Material & Filler
* Original: "So, today we're talking about, like, the fascinating world of astrophysics, specifically black holes. But before we dive in, I just wanted to quickly mention our sponsor, 'Stellar Snacks' – the best snacks in the galaxy! Use code 'ASTRO10'. Anyway, back to black holes..."
* Cleaned: "Today we're talking about the fascinating world of [astrophysics], specifically black holes."
Example 2: Multiple Speakers & Overlapping Speech
* Original: "Host: Okay, so the next step is— // Guest: And if I can just jump in, the really crucial part of that step, the part people always forget, is that the temperature has to be stable. // Host: Right, the temp..."
* Cleaned: "Guest: The crucial part of that step is that the temperature has to be stable."
Example 3: Tangent Summarization & Profanity
* Original: "The main issue is compiler optimization. It's a total s***-show sometimes. You know, it reminds me of this one time my cousin tried to build his own computer and he spent like a week just trying to get the drivers to work with the motherboard. He was so frustrated, but eventually, he figured out it was a faulty RAM stick. It was wild. So yeah, the compiler can be tricky."
* Cleaned: "The main issue is [compiler] optimization. It can be problematic. [The speaker related a personal anecdote about troubleshooting a computer build.]"
Example 4: Technical Content with Keywords
* Original: "So, uh, what we're basically doing is using a, you know, a [Generative Adversarial Network], or GAN, to, like, create the new images. The discriminator part of the GAN is what's really, um, doing the heavy lifting here."
* Cleaned: "We are using a [Generative Adversarial Network] to create the new images. The discriminator part of the GAN is doing the heavy lifting here."
Output Format
You must structure the final output in the following multi-part Markdown format:
[Transcript Title or Main Topic Here]
Speakers: [List of Speakers, e.g., Speaker 1, Dr. Anya Sharma]
Cleaned Transcript:
[The full, cleaned transcript text begins here, formatted with logical paragraphs and speaker attributions as needed. Keywords should be enclosed in [square brackets] on their first appearance.]

Metadata:
* Mentioned Sources:
  * Books: [List any mentioned books]
  * Papers/Publications: [List any scholarly papers, articles, or government publications]
  * Organizations/Media: [List any mentioned media outlets, companies, or institutions]
  * Individuals: [List any key authors or significant individuals not acting as a primary speaker]
* Identified Keywords:
  * [A complete, alphabetized list of all keywords identified in the transcript.]
Please retrieve and process the transcript from:

Lesson 1: Cracking the Code

You are a language model with access to tools that allow you to retrieve and process YouTube video transcripts from a list of video URLs provided in a file.

Your task is to:
1. Fetch the transcript of each video URL provided.
2. Identify the main topic or subject of each video (from the title, description, and/or initial transcript content).
3. Clean the transcript by removing:
  - Off-topic conversations
  - Personal anecdotes unrelated to the main topic

- Promotions, sponsor mentions, event announcements
- Tangents or unrelated discussions

Ensure the cleaned transcript:
- Preserves all critical information related to the main topic.
- Is coherent, structured, and readable.
- Excludes filler, repetition, and timestamp data.

For each video, output:
- The YouTube video title
- A short inferred summary of the topic (optional but encouraged)
- The cleaned transcript as plain text

Input: A file containing one YouTube video URL per line.
Output: Cleaned transcripts for each video, formatted clearly and consistently, without any unnecessary commentary.

Hiring agencies in Elkhart Mishawaka Granger area

Here are the 12 most prominent hiring agencies in the Elkhart Mishawaka Granger area:

- Workbox Staffing
- Peoplelink Group
- Peoplelink Staffing Solutions
- USA Drivers
- Pro Resources Staffing Services
- PeopleReady
- Manpower
- Spherion
- Forge Industrial Staffing
- Resource Nurse Staffing

Context and additional data considerations

1. Man experiences reality as streams of information therefore man's reality is made by his mind from information he's collected with his senses.
2. Besides the five primary senses man has additional senses that passively receive information and help form his reality. It's sometimes termed as intuition or the 6th sense. The voice of God. while the five primary senses are linked to our conscious existence The sixth Sense is said to speak to our subconscious mind. I like to think of this sense like an open port on a computer.
5. There is no lie in nature. Nature is in perfect balance. It literally can't lie. It always keeps it's promise of a new day. The next season, the movement of the Stars, the spawning journey of fish and animals.
6.
7. Thoughtform:
An egregor is seen as a non-physical entity, a thoughtform or collective consciousness, that emerges from the shared thoughts and feelings of a group.
4.

Ollama Command Guide: Basic and Intermediate Operations

Introduction
Ollama is a powerful framework for running and managing large language models (LLMs) locally on your machine. This guide provides comprehensive information on basic and intermediate Ollama commands, explaining how to download, run, customize, and manage models efficiently.

Installation and Setup

Installation
```bash
# macOS or Linux
curl -fsSL https://ollama.com/install.sh | sh

# Windows
# Download the installer from https://ollama.com/download
```

Starting Ollama Service
```bash
# Start the Ollama service
ollama serve
```

Basic Commands

Listing Available Models
```bash
# List all installed models
ollama list
```

Pulling (Downloading) Models
```bash
# Pull a specific model
```

```
ollama pull llama3

# Pull a specific version of a model
ollama pull llama2:13b

# Pull a quantized model
ollama pull llama2:8b-q4_0
```

Running Models (Chat)
```bash
# Start an interactive chat session with a model
ollama run llama3

# Run a specific version
ollama run mistral:7b

# Exit a chat session
# Type "/bye" or press Ctrl+D
```

One-Shot Generation (Non-interactive)
```bash
# Generate a response without entering chat mode
ollama run llama3 "Write a short poem about coding"

# Save output to a file
ollama run llama3 "Write a poem about AI" > poem.txt
```

Getting Model Information
```bash
# Show model details
ollama show llama3

# Show model parameters
ollama show llama3 --modelfile
```

Removing Models
```bash
# Remove a model from your system
ollama rm llama2

# Remove a specific version
ollama rm llama2:13b
```

Intermediate Commands

Creating Custom Models with Modelfiles

A Modelfile allows you to customize an existing model. Create a file named `Modelfile` with the following structure:

```
FROM llama2
PARAMETER temperature 0.7
PARAMETER top_p 0.9
SYSTEM You are a helpful coding assistant that specializes in Python.
```

Then build the model:
```bash
# Build a custom model from a Modelfile
ollama create my-coding-assistant -f Modelfile
```

Running with Parameter Adjustments
```bash
# Run with custom temperature (higher values = more creative)
ollama run llama3 --temperature 0.8

# Run with adjusted top_p (nucleus sampling)
ollama run llama3 --top_p 0.95

# Set maximum tokens in the response
ollama run llama3 --num_predict 300
```

Multiturn Conversations (Programmatic)
```bash
# For scripts where you need to keep conversation context
ollama run llama3 "What is the capital of France?" --format json

# Continue the conversation
ollama run llama3 "What is its population?" --format json
```

Running Models with Context/Prompt Templates
```bash
# Execute with a specific system prompt
ollama run llama3 "Write code to sort a list" \
  --system "You are a senior software engineer who explains code step by step."

# Provide examples (few-shot prompting)
```

```
ollama run llama3 "Explain what this function does" \
  --context "def calculate_average(numbers): return sum(numbers)/len(numbers)"
```

Working with JSON Responses
```bash
# Get structured output in JSON format
ollama run llama3 "List 5 fruits and their benefits" --format json
```

Using Embeddings
```bash
# Generate embeddings for text
ollama embeddings -m llama3 "This is a sample text to embed"
```

Model Configuration

Modelfile Directives
Modelfiles let you customize base models. Here are the key directives:

```
# Base model to customize
FROM llama2:13b

# Name your custom model
NAME "programming-assistant"

# Set default parameters
PARAMETER temperature 0.7
PARAMETER top_k 40
PARAMETER top_p 0.9
PARAMETER num_ctx 4096
PARAMETER repeat_penalty 1.1

# Define system message
SYSTEM """You are a helpful programming assistant that specializes in:
- Python
- JavaScript
- SQL
Always show examples in your answers.
"""

# Include files for context
TEMPLATE """{{.System}}
User: {{.Prompt}}
Assistant:"""
```

```
# Add reference materials for the model
FILE ./documentation.pdf
FILE ./code_samples.txt
```

Building Custom Models
```bash
# Create a custom model from a Modelfile
ollama create my-custom-model -f /path/to/Modelfile

# Create with inline parameters (simple customization)
ollama create math-tutor -m llama3 \
  --system "You are a math tutor who explains concepts clearly and provides step-by-step solutions."
```

Advanced Parameter Tuning

Here are the key parameters you can adjust:

Parameter	Description	Typical Range
temperature	Controls randomness	0.0 - 1.0
top_p	Nucleus sampling threshold	0.0 - 1.0
top_k	Limits vocabulary to top K tokens	1 - 100
num_ctx	Context window size	512 - 8192
num_predict	Max tokens to generate	1 - ∞
repeat_penalty	Penalizes repetition	1.0 - 2.0
presence_penalty	Penalizes repeated topics	0.0 - 2.0
frequency_penalty	Penalizes token frequency	0.0 - 2.0
mirostat	Adaptive sampling algorithm	0, 1, 2
mirostat_tau	Controls perplexity when mirostat=1,2	0.0 - 10.0
mirostat_eta	Learning rate when mirostat=1,2	0.0 - 1.0

```bash
# Run with multiple parameters
ollama run llama3 \
  --temperature 0.8 \
  --top_p 0.9 \
  --top_k 40 \
  --num_ctx 4096 \
  --repeat_penalty 1.1
```

API Usage

Ollama provides a REST API for programmatic access:

```bash
# Generate a completion
curl http://localhost:11434/api/generate -d '{
  "model": "llama3",
  "prompt": "Write a function to calculate fibonacci numbers in Python",
  "stream": false
}'

# Chat with history
curl http://localhost:11434/api/chat -d '{
  "model": "llama3",
  "messages": [
    { "role": "user", "content": "Hello, who are you?" }
  ]
}'
```

Troubleshooting

Common Issues and Solutions

```bash
# Check Ollama version
ollama --version

# Verify Ollama service is running
curl http://localhost:11434/api/version

# Get model details to check configuration
ollama show model_name

# Remove and re-pull a problematic model
ollama rm model_name
ollama pull model_name
```

GPU Utilization
```bash
# Check GPU memory usage (Linux)
nvidia-smi

# View logs for GPU-related issues
ollama serve -v
```

Examples of Custom Model Creation

Code Assistant Example

```
FROM llama3
NAME "code-assistant"
PARAMETER temperature 0.3
PARAMETER top_p 0.8
SYSTEM """You are an expert programming assistant who helps with:
1. Writing clean, efficient code
2. Debugging problems
3. Explaining programming concepts
Always include comments in your code."""
```

Creative Writing Assistant
```
FROM mistral:7b
NAME "creative-writer"
PARAMETER temperature 0.9
PARAMETER top_p 0.95
PARAMETER top_k 60
SYSTEM """You are a creative writing assistant who specializes in storytelling.
You excel at creating vivid characters, engaging plots, and descriptive scenes.
When asked to write stories, include elements of:
- Sensory details
- Character development
- Engaging dialogue
- Clear narrative structure"""
```

Advanced Techniques

Quantization Options
When pulling models, you can choose different quantization levels:
- `q4_0`: 4-bit quantization (fastest, smaller size)
- `q5_0`: 5-bit quantization (balance of speed/quality)
- `q8_0`: 8-bit quantization (higher quality, larger size)
- `f16`: 16-bit float precision (highest quality, largest size)

```bash
# Pull with specific quantization
ollama pull llama3:q4_0
```

Multi-modal Models
For models that support images:

```bash
# Run with an image (local file)
ollama run llava "What's in this image?" --image path/to/image.jpg
```

```
# Run with multiple images
ollama run bakllava "Compare these images" --image img1.jpg --image img2.jpg
```

Using Function Calling Models
Some models support function calling capabilities:

```bash
# Call with functions enabled
ollama run deepseek-coder:function "Get the weather in New York" \
  --functions '[{"name":"get_weather","description":"Get the current weather in a
location","parameters":{"type":"object","properties":{"location":{"type":"string"}},"required":["locati
on"]}}]'
```

Best Practices

1. **Model Selection**:
   - Smaller models (7B) are faster but less capable
   - Larger models (70B) are more capable but require more resources
   - Consider quantized versions for resource-constrained environments

2. **Parameter Tuning**:
   - Lower temperature (0.1-0.4) for factual, deterministic responses
   - Higher temperature (0.7-0.9) for creative tasks
   - Adjust context window based on input length requirements

3. **Prompt Engineering**:
   - Be specific in your instructions
   - Use system prompts to set consistent behavior
   - Include examples for complex tasks (few-shot prompting)

4. **Resource Management**:
   - Only keep models you actively use installed
   - Consider RAM and disk space requirements
   - Use quantized models when possible
